

Habitus — Pitch Deck

An AI real-estate agent — a “digital urbanist-detective”. Full slide-by-slide content brief. Language of the deck: English.

HOW TO USE THIS DOCUMENT. This is a content brief for generating a 13-slide pitch deck. Apply **our existing design system** (colors, fonts, logo, layout grid) — do not invent a new visual style. Keep the tone confident, concrete and technical; investors are the audience. **Write every slide in English.** Prefer short, punchy on-slide copy (headline + 3–5 bullets max); put the longer explanations into the speaker notes. Highlight the three product advantages — **Convenient · Precise · Honest** — wherever they fit. Fields per slide: **Headline** (big on-slide title), **On-slide** (bullet copy), **Visual** (what to show), **Speaker notes** (what the presenter says).

Global messaging — the spine of the pitch

One-liner: Habitus turns a plain-language wish into a ranked shortlist of real apartments, each with a lifestyle dossier — grounded in real city data, never invented.

The problem in one sentence: People buy a way of life, but every listing portal only lets them filter square meters.

Why we win (repeat this trio everywhere):

Convenient — one conversation in natural language replaces a dozen browser tabs and manual filters.

Precise — we rank by real life: family logistics, social surroundings, sunlight, noise and the view — not just price and size.

Honest — every claim is grounded in database facts; if data is missing, the block degrades — we never invent a number or hallucinate.

Golden thread of the pitch: “A home is a 10–15 year, multi-million decision made blind today. Habitus makes it informed.”

Slide-by-slide content

1 Title

HOOK

HEADLINE

Habitus

SUB

An AI real-estate agent — your “digital urbanist-detective.”

ON-SLIDE

Logo · one-line tagline · team name · hackathon name & date.

VISUAL

Full-bleed hero using our design system. A single striking product screenshot (map + ranked results) behind a dark overlay.

SPEAKER NOTES

Open with the golden thread: buying a home is the biggest decision most people make — and today they make it blind.

2 The Problem

PAIN

HEADLINE

People choose a way of life. Portals only sell square meters.

ON-SLIDE

- Listing portals (CIAN, Avito, Zillow-like) are spreadsheet filters: price, area, rooms, a pin.
- The real questions have no filter: “Can my child walk to a good school without crossing a highway?” · “Afternoon sun or a wall?” · “Bars roaring under the window?”
- Buyers stitch together dozens of sources by hand — and learn the truth only after moving in, when it’s late and expensive.

VISUAL

Split screen: a boring filter form vs. a messy pile of browser tabs (maps, school ratings, noise maps).

SPEAKER NOTES

Make it visceral with one persona — a family relocating with a school-age child.

3 The Solution

AHA

HEADLINE

Say what you want. Get a ranked shortlist — with a dossier on each home.

ON-SLIDE

- Input: one natural-language request — “a quiet 2-room near the metro under 40M, windows south-west, no bars underneath.”
- Output: a ranked list of real apartments + a lifestyle **dossier** per object.

VISUAL

The actual product: chat input on the left → ranked cards + map on the right. Real screenshot from our UI.

SPEAKER NOTES

This is the “aha”. Show, don’t tell — ideally a 10-second live/GIF demo of one query resolving.

HEADLINE

Three layers no filter can replicate

ON-SLIDE

- **Multi-hop lifestyle routing** — closed daily route graphs for the whole family (walk / scooter / transit / car), with reachability isochrones. Verifies the child's route never crosses a major road.
- **Social-demographic audit** — the “hidden” profile around a building: communal-flat share, bar & liquor-store density, crime heat maps.
- **“The view from the window”** — real insolation by season, arterial-road noise, and the view itself: courtyard-well, blank wall, or park.

VISUAL

Three icon columns (route / people / sun) each with a mini map or diagram.

SPEAKER NOTES

This is the moat of insight — data no portal computes.

HEADLINE

Every home comes with an evidence-based dossier

ON-SLIDE

- A verdict headline + confidence + how many layers were checked.
- Blocks: family routing · social environment · view/climate · sun · noise — each graded A+...D, each backed by a real metric.
- Ask any object a free-form question — answers cite the exact facts they stand on.

VISUAL

A real dossier screenshot with callouts pointing at grade, metric and the route drawn on the map.

SPEAKER NOTES

Tie back to trust: notice every statement is attached to a fact.

HEADLINE

Convenient · Precise · Honest

Convenient — one chat in plain language replaces a dozen tabs and manual filters.

Precise — ranking by logistics, surroundings, sunlight and view — not just price and size.

Honest — grounded answers only; missing data degrades a block gracefully, we never fabricate a number or hallucinate. *(In the schema: evidence paths, “unknown” status, explicit “degraded” flags.)*

VISUAL

Comparison table “Habitus vs. classic portals” — rows: input, ranking basis, hidden-context, trust/grounding.

SPEAKER NOTES

For a decision that costs an apartment, trust is not a feature — it is the foundation.

HEADLINE

Two motions: B2C reach, B2B revenue

B2C users	B2B customers
Families with children · remote workers · couples before a purchase (joint mortgage, planning a child)	Listing aggregators · developers · banks / mortgage · realtors

ON-SLIDE

Add TAM/SAM/SOM if numbers are ready. Anchor to the size of the residential real-estate + proptech market in the target geography.

VISUAL

Two-column persona strip; optional funnel TAM→SAM→SOM.

SPEAKER NOTES

B2C proves the magic; B2B integrations scale the revenue. [Insert real market figures for the target region.]

HEADLINE

Subscription now, API layer at scale

ON-SLIDE

- **B2C** — freemium search; premium subscription unlocks full dossiers & unlimited queries.
- **B2B** — Habitus embeds via API as a smart-search + dossier layer inside portals, banks and developer sites (per-seat / per-call / white-label).
- Lean cost base — we **orchestrate** ready models (no proprietary training), so gross margins stay high.

VISUAL

Two revenue pillars with example price tags. **[Confirm pricing.]**

SPEAKER NOTES

Emphasize capital efficiency: value is in orchestration + hybrid RAG, not GPU training bills.

HEADLINE

Agent orchestration over a geospatial RAG database

ON-SLIDE

- **Pipeline:** NLU (LLM parses the wish → structured query) → hybrid retrieval (SQL filters + dense + sparse, fused with RRF) → proximity re-rank + cross-encoder → grounded explanation.
- **Stack:** BGE-M3 embeddings + bge-reranker · Postgres 16 + PostGIS + pgvector · Qwen-72B via OpenRouter · FastAPI (ML) · Go/Fiber gateway with SSE streaming · Next.js.
- **Resilient by design:** every layer degrades independently — no LLM key → semantic search still works; no isochrone service → radius fallback.

VISUAL

Clean architecture diagram: browser → frontend → gateway → ML-service → DB, with the 3 agents (Linguistic / Geo-Spatial / Context-Analytic) called out.

SPEAKER NOTES

Key defensibility line: we don't train a model — the value is orchestration + hybrid RAG over real city data.

HEADLINE

Working end-to-end today

ON-SLIDE

- Offline + online pipelines are built and running; the full stack boots with one `docker compose up` .
- Live endpoints: search · dossier · per-object Q&A · geo layers, with real streaming to the UI.
- Real Moscow / St. Petersburg data ingested; quality tracked with an eval suite (recall / nDCG / MRR).

VISUAL

A short demo GIF + a couple of metric chips. **[Insert current eval numbers.]**

SPEAKER NOTES

Stress this is not a mockup — it runs.

HEADLINE

Two curves just crossed

ON-SLIDE

- City data (building geometry, POIs, school registries, noise & crime layers) is finally accessible.
- LLMs can now reliably turn a fuzzy human wish into strict SQL + vector queries.
- Habitus sits exactly at that intersection.

VISUAL

Two rising curves meeting at a “Habitus” point.

SPEAKER NOTES

This was impossible to build well even two years ago.

HEADLINE

The team to build it

ON-SLIDE

Photos, names, roles, one-line relevant credential each. **[Insert team members.]**

VISUAL

Clean team grid in our design system.

SPEAKER NOTES

One sentence on why this team is uniquely able to execute (ML + geo + product).

HEADLINE**From a lottery to an informed decision****ON-SLIDE**

- Recap the trio: **Convenient · Precise · Honest.**
- The ask / next steps. **[What you want from the jury / investors.]**
- Contact + QR to the live demo.

VISUAL

Bold closing statement on a hero background; QR code to the running product.

SPEAKER NOTES

End on the golden thread: we turn the biggest blind decision people make into an informed one.
